## PREFACE.

FOR the years 1911 to 1913, "Hourly Values from Autographic Records" was published in two sections. The issue of the first section, which contained hourly values of pressure, temperature, humidity, wind, rainfall, and sunshine, is now discontinued. The present volume represents the Section 2 of former years, and is the tenth of the series. It may be regarded as a continuation in extended form of the tables and summaries giving the results of observations in terrestrial magnetism and atmospheric electricity which were included in the Reports of the Committee of Management of the Kew Observatory from 1842 to 1910, and of tables published by the Meteorological Office in the *Quarterly Weather Report* from 1869 to 1880, and thereafter in *Hourly Readings*.

The tables of the present volume fall into three groups. In the first group the mean daily variation of the various meteorological elements is given for each month. The figures refer to the five observatories, Aberdeen, Eskdalemuir, Cahirciveen (Valencia Observatory), Richmond (Kew Observatory), and Falmouth.

In the second group fall Tables I to XLVIII, in which the readings of the magnetographs at Eskdalemuir Observatory for each hour throughout the year are set out, together with appropriate notes; Tables XLIX to LXIV, giving results deduced from these readings and corresponding figures for Kew Observatory; and Tables LXVII and LXVIII, in which magnetic data for various stations, British and foreign, are set out.

In the third group are the three tables which show the mean daily variation of potential gradient at Richmond and Eskdalemuir. The values from which the means have been computed are not published.

The tables are followed by notes on the management of the magnetic and electrical instruments and on results of interest. For notes on the meteorological instruments reference may be made to the Year Book, Part IV, Section 1, 1913. Notes on the Meteorological Summaries are included in this volume.

It will be noticed that the tabulation of the autographic records at the Meteorological Office Observatories which provides the material for this volume also yields information which is not printed here, such as the daily values of the extremes of temperature and other meteorological elements, and the range of magnetic force. For this information reference should be made to the *Geophysical Journal* issued as Part III, Section 2, of the British Meteorological and Magnetic Year Book.

G. C. SIMPSON,  
*Director.*

## LIST OF OBSERVATORIES.

|   | Latitude.  | Longitude. | G.M.T.<br>of Local<br>Mean Noon. | Height<br>above M.S.L.<br>in metres. |
|---|------------|------------|----------------------------------|--------------------------------------|
| <b>Central Observatory:</b><br>Kew Observatory, RICHMOND, Surrey                | 51° 28' N. | 0° 19' W.  | 12 1                             | 5.5                                  |
| <b>Magnetic Observatory:</b><br>ESKDALEMUIR, Dumfriesshire ..                   | 55 19 N.   | 3 12 W.    | 12 13                            | 242.0                                |
| <b>Western Observatory:</b><br>Valencia Observatory, CAHIRCIVEEN,<br>Co. Kerry. | 51 56 N.   | 10 15 W.   | 12 41                            | 9.1                                  |
| <b>Auxiliary Observatories:</b><br>ABERDEEN (Meteorology) .. ..                 | 57 10 N.   | 2 6 W.     | 12 8                             | 14.0                                 |
| FALMOUTH (Meteorology) .. ..  | 50 9 N.    | 5 4 W.     | 12 20                            | 50.8                                 |

*Notes.*—(1) The height given is that of the site of the rain-gauge. The heights of other meteorological instruments are shown under the appropriate Tables.

(2) Values printed in *italic* type in the following Tables are obtained by interpolation.

(3) Daily mean values are computed as  $\frac{1}{24} \left\{ \frac{1}{2} (0 + 24) + (1 + \dots + 23) \right\}$

**HOURLY VALUES FROM AUTOGRAPHIC RECORDS.**

RELATIVE HUMIDITY: MONTHLY MEANS OF HOURLY VALUES.

Percentages, deduced from thermometer readings at exact hours, Greenwich Mean Time, by Glaisher's method.

**Aberdeen:** North Wall Screen on Tower:  $ht$  (height of thermometer bulb above the ground) = 12.5 metres.**1920.**

**METEOROLOGICAL SUMMARY.**

WIND SPEED: MONTHLY MEANS OF HOURLY VALUES.

Averages, in metres per second, for periods of sixty minutes centered at the exact hours, Greenwich Mean Time.

1920.

**Aberdeen:**  $H_a$  (height of anemometer above M.S.L.) = 37 metres. $h_a$  (height of anemometer above ground) = 23 metres.

## HOURLY VALUES OF AUTOGRAPHIC RECORDS.

## RAINFALL: MONTHLY TOTALS OF HOURLY VALUES.

Amounts, in millimetres, for periods of sixty minutes,\* centered at the exact hours, Greenwich Mean Time.

**Aberdeen**: H, (height of receiving surface above M.S.L.) = H (height of station above M.S.L.) + h, (height of receiving surface above ground). **1920.**  
 = 14.0 metres + 0.6 metres.

Note.—The hourly duration of Sunshine is obtained from the records of the Campbell-Stokes Recorder, an instrument in which the sun's rays are focussed through a 10 cm. spherical lens of crown glass upon a strip of blue card exposed in a metal bowl, the duration of bright sunshine being shown by the length of the scorch on the card.

For Falmouth see p. 53.

TABLE IV.—AUXILIARY OBSERVATIONS IN ABSOLUTE MEASURE; DAILY VALUES OF TEMPERATURE IN THE EAST ROOM OF MAGNET HOUSE; MAGNETIC NOTES FOR THE MONTH.

January, 1920.

| Date   | Time<br>G.M.T. |       | Hori-<br>zon-<br>tal<br>Force. | Declina-<br>tion. | Dip.    | Tempera-<br>ture in<br>Magnet House. | Mag-<br>netic<br>Char-<br>acter<br>of day<br>(o-2). | Date.                  | MAGNETIC NOTES.   |  |
|--------|----------------|-------|--------------------------------|-------------------|---------|--------------------------------------|---|------------------------|---|--|
|        | From           | To    |                                |                   |         |                                      |   |                        | January, 1920.  |  |
| Jan. 8 | II 32          | II 59 | 16727                          | 17 2 28           | 69 38.7 | a<br>4.6<br>4.5<br>4.5<br>4.5<br>4.4 | I<br>I<br>I<br>I<br>I                               | II                     | The mean character figure o.45 was higher than in June, July or August, but judged by the mean value of $\Sigma R^2$ this was the quietest month of the year. On the 27th, the absolute daily range in V was only 5γ. The most disturbed days were the 11th, 17th, and 21st. A sudden commencement is shewn at 11d. 13h. 9m., but the subsequent disturbance was on a very moderate scale, and was chiefly shewn on the W. component, and lasted only 18 hours. Bays are shewn on the N. trace centering at 2d. 12h. 20m.; 12d. 21h. 10m.; 15d. 23h. 24m.; 17d. 23h. 36m.; 21d. 22h. 35m.; 28d. 23h. 25m.; and on the W. trace centering at 14d. 21h. 9m.; 21d. 17h. 25m.; 22d. 16h. 40m. |  |
| 14     | 10 55          | II 21 | 16712                          | 17 0 32           | 69 38.9 | 4.3<br>4.3<br>4.3<br>4.3<br>4.3      | OC<br>OC<br>OC<br>OC<br>I                           | II<br>I<br>I<br>I<br>I | EXPLANATORY NOTE.   |  |
| 19     | 12 7           | 12 12 | 16701                          | 17 2 4            | 69 40.2 | 4.1<br>4.1<br>4.1<br>4.1<br>4.0      | OC<br>OC<br>OC<br>ID<br>O                           | II<br>I<br>I<br>I<br>I | Extreme values of each component of magnetic force are given for each day in the <i>Geophysical Journal</i> . The daily means given in Table I to III are computed as $\frac{1}{24} [ \frac{1}{2} (o + 24) + (I + \dots + 23) ]$ .  |  |
| 21     | 10 59          | II 26 | 16682                          | 17 4 5            | 69 40.2 | 4.0<br>4.0<br>4.0<br>4.0<br>4.0      | ID<br>O<br>I<br>O<br>O                              | II<br>I<br>I<br>I<br>I | "Temperature in Magnet House" is the mean of the corrected readings, at 9h. 30m. G.M.T., of the thermometers in N., W., and V. magnetograph boxes.  |  |
| 30     | 10 59          | II 25 | 16694                          | 16 57 40          | 69 39.4 | 3.9<br>4.0<br>4.0<br>3.9<br>3.9      | O<br>OC<br>ID<br>O<br>O                             | II<br>I<br>I<br>I<br>I | The times of the absolute observations are those of the declination and dip observations only. The horizontal force values refer to the mean time of the declination observations, being derived by a combined use of the actual observations and curve measurements.   |  |

## TERRESTRIAL MAGNETISM.

27

Eskdalemuir. (Z.)

XXVII.—TERRESTRIAL MAGNETIC FORCE: VERTICAL COMPONENT.  
Mean Values for Periods of 60 Minutes centered at the Hours of Greenwich Mean Time.

July, 1920.

44,000 γ (·44 C.G.S. unit) +

MAGNETIC NOTES.

*September, 1920.*

This month was characterised by increased activity, the mean character figure being 0.73. The 25th was an especially quiet day. The principal disturbances were those of 3rd to 4th, 8th to 9th, 22nd to 23rd, and 28th to 29th. During the first of these, a prominent double oscillation on all three components was recorded between 3d. 19h. 18m. and 3d. 20h. om., the range being  $> 271\gamma$  N ;  $151\gamma$  W ;  $414\gamma$  V. The movement on N. was especially rapid, being about  $17\gamma$  per minute during the fall to the minimum. The storm of the 28th to 29th, was preceded by a large but markedly slow sudden commencement at 27d. 23h. om., but the main disturbance did not begin until 28d. 13h. Its range was  $> 405\gamma$  N ;  $> 352\gamma$  W. ; and  $> 414\gamma$  V. ; the three traces going off the sheet at the minima. The vertical force record was of unusual form, in that a minimum occurred at the very early hour of 20h. 10m. (approx.) and the trace afterwards rose to a height above the undisturbed value before falling to a secondary minimum soon after 2h. on the 29th. In addition, the V. trace shewed a much greater degree of irregularity than is usual.

XLVIII.—AUXILIARY OBSERVATIONS IN ABSOLUTE MEASURE: DAILY VALUES OF TEMPERATURE IN

Eskdalemuir.

THE EAST ROOM OF MAGNET HOUSE: MAGNETIC NOTES FOR THE MONTH

December, 1920.

## HOURLY VALUES FROM AUTOGRAPHIC RECORDS.

## XLIX.-LI.—DIURNAL INEQUALITIES OF THE GEOGRAPHICAL COMPONENTS OF MAGNETIC FORCE.

(Not corrected for the effect of the North Force on the West Magnetograph, or vice versa, or for the effect of the Horizontal Force on the V.F. Balance.)

Mean Hourly Values, Greenwich Mean Time, for the Months, Year, and Seasons.

| Month and Season. | Hour<br>I | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | Noon | 13 | 14 | 15 | 16 | 17 | 18 | 19 | 20 | 21 | 22 | 23 | Midt. |

## TERRESTRIAL MAGNETISM.

LXIII.—RANGE OF MEAN DIURNAL INEQUALITIES FOR THE MONTHS, YEAR, AND SEASONS OF 1920,  
AT ESKDALEMUIR AND RICHMOND (KEW OBSERVATORY).

Note.—The ranges are those shown in Tables XLIX. to LXII., in the preparation of which the non-cyclic change has been eliminated (see Table LXIIIa).

| Month and Season | ESKDALEMUIR. |           |           |             |           |          |                 |           |           |             |      |      |             |      |      | RICHMOND.       |      |       |       |       |      |

The data for 2, 4, 25 Jan., 8 Feb., 10 June, and 26 Nov. have been excluded, owing to imperfection of record on these dates.

\* See footnote on page 63.

## HOURLY VALUES FROM AUTOGRAPHIC RECORDS.

LXIV.—HARMONIC COMPONENTS OF THE DIURNAL INEQUALITY.\*

Values of  $a_n$ ,  $b_n$  in the series  $\Sigma (a_n \cos 15nt^\circ + b_n \sin 15nt^\circ)$ ,  $t$  being reckoned in hours from midnight G.M.T.

Eskdalemuir.

(Longitude of Eskdalemuir Observatory,  $3^{\circ} 12' W.$ )

1920.

LXIVa.—HARMONIC COMPONENTS OF THE DIURNAL INEQUALITY.\*

Values of  $c_n$ ,  $a_n$  in the series  $\sum c_n \sin(15nt^\circ + x_n)$ ,  $t$  being Mean Local Time reckoned in hours from midnight.

Eskdalemuir.

(Longitude of Eskdalemuir Observatory,  $3^{\circ} 12' W.$ )

1920.

## Notes on the Meteorological Summaries.

---

In the meteorological tables in the present volume the diurnal variation of pressure, temperature, humidity, rainfall, sunshine and windspeed is shown. The tables differ from those published for the years 1911 to 1917 in that the 1920 values of the various elements are printed, not their departures from normal. These values are averages for the months and the year; the individual readings from which the averages are derived are available for reference at the Meteorological Office. For the years 1874 to 1886 and 1900 to 1913 such hourly readings were published *in extenso*. For the years 1869 to 1889 and 1887 to 1899 five-day means were printed.

The normal hourly values computed for periods ending 1915 will be found in the 1917 volume.

In the tables for pressure, temperature and relative humidity, values at 0h. and 24h. are both given. The small difference between them is due to the fact that the readings at the midnights with which a month opens and closes are in general different. In estimating the mean of all the readings for the month these first and last readings are given half-weight. In preparing the tables of the diurnal inequalities of pressure and temperature the non-cyclic change has been eliminated by the use of the formulæ given in footnotes.

Particulars of the methods of tabulation and of the instruments are published in the Introduction to *Part IV., Section 1* of the *Year Book* for 1913 and in the *Annual Reports of the Meteorological Office* for the years 1867 and 1869. The barographs and the thermographs with dry and wet bulbs are photographic; the speed of the wind is recorded by cup anemometers, except at Eskdalemuir where a tube-anemometer is used for the hourly tabulations; the rain gauges in use are of Beckley's pattern; the duration of bright sunshine is measured by the Campbell-Stokes sunshine recorder.

The values in the tables have been expressed throughout in units based upon the C.G.S. system; tables for conversion to other units were given with the Notes for 1913. They will be found in the *Computer's Handbook*.

Some points of importance in the history of the observations are referred to in the Notes for 1917. They are not reproduced here as the present tables cover only the year 1920. It should be mentioned, however, that the system of time-marking previously in use introduced some uncertainty in the readings of the barograms and thermograms. The time marks occur at intervals of two hours and alternate readings used to be made at a time-mark and halfway between two time-marks. From January 1st, 1918, the time-marks have been made half-an-hour before each even hour instead of at the hour so that there is an unbroken curve for the hourly readings.

(a) *Pressure*.—The barometer readings are obtained from the hourly tabulations of photographic records from similar apparatus at all the observatories. Due allowance is made for the variation of gravity with latitude. The pressures refer to station level, *i.e.*, to the level of the cistern of the control-barometer, the readings of the curves being compared three times a day with those of this barometer. Tables for "reduction" of pressure to sea-level are printed in the Introduction to *Part IV., Section 1* of the *Year Book* for 1913.

(b) *Temperature of the Air.*—Temperature is expressed in degrees absolute on the Kelvin Scale. The value of a degree is the same as on the centigrade scale, but the zero is taken to be the absolute zero of temperature,  $273^{\circ}\text{C}$ . below the normal freezing-point of water. The practice of indicating "degrees absolute" by "a" instead of by  $^{\circ}\text{A}$  has been adopted recently. Thus the temperature of the freezing point of water is written  $273\text{a}$ . Conversion from the centigrade to the absolute scale is a simple addition or subtraction. Tables for converting from the Fahrenheit to the absolute scale are given in the *Computer's Handbook*.

The temperatures shown for all four Observatories have been derived from the tabulation of photographic records from similar mercurial thermometers. At Eskdalemuir the thermometer screen is a large hut with louvred sides. At the other observatories the screen is on the north wall of the observatory building. In the case of Aberdeen the screen in question is the tower of King's College at a height of  $12.5\text{m}$ . above ground.

At Valencia Observatory the north wall screen was modernised at the beginning of 1919 by the provision of a double roof, double louvres on all sides and a ventilated bottom to exclude all direct radiation. It was formerly a single louvred wooden shelter.\*

(c) *Relative Humidity* is obtained from the tabulation of the photographic records of temperature combined with those of the wet-bulb thermometer. The thermometers are similar at all the Observatories; they have cylindrical bulbs about four inches long. The values of the humidity are calculated by the use of the Meteorological Office tables, which are based upon Glaisher's factors.†

The means for Richmond, Eskdalemuir, and Cahirciveen are obtained from the hourly values of humidity for each day; the means for Aberdeen are calculated from the mean hourly values for the month of the dry and wet-bulb temperatures.

Mention should be made here of a difficulty inherent in the psychrometric method of determining the relative humidity of the air. The depression of the wet-bulb reading depends, not only on the amount of vapour present in the air, but also on the strength of the wind blowing past the thermometers. The tables in use for computing the humidity take no account of the wind, and the results are, therefore, open to criticism.

(d) *Wind.*—The speed of the wind is obtained from the records of similar Robinson anemographs at Richmond, Cahirciveen, Falmouth, and Aberdeen, but at Eskdalemuir the records are made by a Dines Pressure-tube instrument. Anemographs of the latter type are also in operation at the other observatories and the charts are used in other publications of the office, e.g., in the *Monthly Weather Report Annual Summary*.

The records from instruments of the two types, exposed at the same place, give approximately the same values for the mean speed.

More serious than any imperfections in the anemometers themselves is the difficulty in determining the relation between the wind which crosses the Observatory at a particular height and the general flow of air in the neighbourhood. In the extreme case of the anemometer at Falmouth,‡ the recorded speed is probably only half of what would be measured at the same height above ground in open country. The anemometer at Cahirciveen is on a tower at the NE corner of the main building, so that the exposure is less free for winds between SE and SW than for other directions.

(e) *Rainfall.*—In this table totals for the hours have been given instead of means. The first and last entries refer to the half hours beginning and ending at midnight.

\* L.H.G. Dines. Meteorological Office Professional Notes No. 23, 1921.

† See Computer's Handbook Section 1.

‡ Not published now.

(f) Sunshine.—The duration of bright sunshine is obtained by the Campbell-Stokes sunshine recorder and is therefore measured by the burning or scorching of a blue card by the focussed sunlight. The values are given in hours and are obtained by dividing the totals for each month by the number of days in the month. It should be noted that the entries refer to Local Apparent Time.

*Harmonic Analysis.*—The systematic analysis of the records of pressure and temperature of the seven observatories of the Meteorological Office by means of the beautiful harmonic analyser invented by W. Thomson (Lord Kelvin) was a notable enterprise of the period 1871–1882. The results for each month of these years are published in *Harmonic Analysis of Hourly Observations of Air Temperature and Pressure at British Observatories*: Official Publication, No. 93. This volume contains also the harmonic components for the average diurnal variation in the several months for the same period.\* Corresponding data for longer periods have not been published by the Office. The annual mean diurnal variation of pressure at the Observatories has been analysed, however, for these Notes for the last few years. Results for 1920 are set out below, the normals for the older observatories being for 1871–1915, those for Eskdalemuir for 1911–1915:—

Obs.)<br>1920 | .181                    | .275           | .021           | .007           | 188.8                             | 17 25 | 135.3          | 10 29 | 334.5          | 2 34  | 298.1          | 2 32  | 199.1                         | 155.9          | 5.4            | 339.3          |       |
| „ Normal                        | .151                    | .307           | .034           | .004           | 177.8                             | 18 9  | 130.9          | 10 38 | 331.9          | 2 37  | 42.3           | 0 48  | 188.1                         | 151.5          | 2.8            | 83.5           |       |

The notation is explained by two alternative formulæ for the inequality in question :

$$P_1 \sin (15t + A_1)^\circ + P_2 \sin (30t + A_2)^\circ + P_3 \sin (45t + A_3)^\circ + P_4 \sin (60t + A_4)^\circ + \dots$$

and

$$P_1 \cos 15(t - T_1)^\circ + P_2 \cos 30(t - T_2)^\circ + P_3 \cos 45(t - T_3)^\circ + P_4 \cos 60(t - T_4)^\circ + \dots$$

Here t is the time elapsed in hours since midnight and  $T_1$ ,  $T_2$ ,  $T_3$ ,  $T_4$  are the times of maxima of the four harmonic terms. The times of the corresponding minima differ from those of the maxima by twelve, six, four, and three hours respectively. While it has been convenient to record all the times to minutes this degree of accuracy can hardly be claimed.

It is of importance to note that whilst the 12-hour term is known to be fairly consistent throughout the year, the other terms are subject to very large changes from month to month.

It may also be mentioned that the "normal" values of the P's refer to the normal diurnal variation. The average values of the P's for individual years would naturally be greater.

\* The results have been discussed by Dr. C. Chree, *Q.J.R. Met. Soc.*, xliv., 1918, p. 99.

## ADDITIONAL INFORMATION.

For a general account of the weather of the year, reference should be made to the Annual Summary of the *Monthly Weather Report*. Daily readings at Richmond, Cahirciveen, and Eskdalemuir are published in the *Geophysical Journal*, corresponding data for Aberdeen in *Daily Readings at Meteorological Stations of the First and Second Orders*. A summary of the monthly values at each of the four observatories is to be found in the Annual Supplement to the last-named publication.

Climatic diagrams based on the average hourly values up to 1910 are given for Aberdeen, Cahirciveen, Falmouth and Richmond in *The Weather Map*.

Graphs of diurnal variation of temperature at the same observatories for the period 1871 to 1895 are given in *Temperature Tables for the British Islands*. The corresponding pressure-graphs are reproduced in a paper by R. H. Curtis.\*

Normal values for various elements are given in the *Book of Normals* which is in course of publication.

\* *Q.J.R. Met. Soc.*, xxvi., 1900, p. 1.

## RAINFALL: MONTHLY TOTALS OF HOURLY VALUES.

Amounts, in millimetres, for periods of sixty minutes\* centered at the exact hours, Greenwich Mean Time.

Falmouth : Hr=50.8 m. + 0.6 m.

TERRESTRIAL MAGNETISM :—I. NOTES ON THE MANAGEMENT OF THE INSTRUMENTS AT KEW OBSERVATORY, RICHMOND, AND ON THE CORRESPONDING TABLES, 1920. BY C. CHREE, Sc.D., LL.D., F.R.S., SUPERINTENDENT.

Absolute observations of declination, dip and horizontal force have been taken usually once a week. The instruments employed have been the Jones' unifilar magnetometer with declination magnet KO 90, collimator magnet K.C.I. and mirror magnet AN, and the Barrow dip circle, No. 33, with  $3\frac{1}{2}$ -inch needles. In the absolute observations of horizontal force, deflections were made at three distances, 22.5, 30, and 40 cms., and values were calculated for the distribution constants P and Q from all the observations of the year, with the exception of one taken during a disturbed time.

The values obtained of late years have been as follows :—

| Year. | P.      | Q.     | Mean Value at<br>22.5, 30 and 40 cms. of<br>$\log_{10}(1+Pr^2+Qr^4)$ |
|-------|---------|--------|--|
| 1910  | + 0.882 | — 1354 | 1.99939  |
| 1911  | + 0.832 | — 1377 | 1.99934  |
| 1912  | + 0.749 | — 1286 | 1.99937  |
| 1913  | + 1.504 | — 1528 | 1.99959  |
| 1914  | + 1.226 | — 1343 | 1.99958  |
| 1915  | + 0.778 | — 1245 | 1.99942  |
| 1916  | + 2.962 | — 2044 | 1.99996  |
| 1917  | + 0.696 | — 1236 | 1.99938  |
| 1918  | + 1.683 | — 1565 | 1.99965  |
| 1919  | + 1.496 | — 1525 | 1.99958  |
| 1920  | + 0.971 | — 1280 | 1.99950  |
| Means | + 1.253 | — 1435 | 1.99952  |

The addition of 0.00047 to the accepted value of  $\log_{10}(1+Pr^2+Qr^4)$  would result in an increase of  $10\gamma$  in the value of H. Changes in P and Q having the same sign tend to neutralise one another. It is reasonable to suppose that the fluctuations shown in the table are partly accidental. It is thus comforting to know that if mean values derived from the whole eleven years had been employed, no yearly mean except that for 1916 would have been altered by more than  $4\gamma$ . The outstanding values in 1916 are presumably mainly due to the collimator magnet being dropped. Originally the observations made during 1920 were reduced, employing the values obtained for P and Q in the previous year. The substitution of values appropriate to 1920 entailed a correction of  $-2\gamma$  in the calculated values of H. This result was, however, obtained in time to secure the publication of the corrected values in the *Geophysical Journal*.

The magnetographs have remained in regular operation during the year. The scale value of the declination magnetograph remained as in previous years 1 mm. =  $0'87$ . On March 19th, 1920, the position of the mirror attached to the magnet was slightly altered so as to bring the trace further up the sheet. Scale value determinations of the horizontal force made at the beginning and end of the year gave  $5.9\gamma$  and  $5.8\gamma$  respectively as the equivalents of 1 mm. The former value was accepted for the first six months, the latter for the second six months of the year. A temperature correction of  $3.1\gamma$  for  $1^\circ C$  was applied to the curve readings as in previous years. The base values of the declination and horizontal force curves were derived in the usual way from the absolute observations. Scale value determinations were also made of the V magnetograph at the beginning of the year, in July, and at the end of the year, the values obtained as the equivalents of 1 mm. being respectively  $12.2\gamma$ ,  $11.3\gamma$  and  $10.5\gamma$ .

The disturbance of the magnetic curves by artificial electric currents has been much as in the previous year. The publication of diurnal inequalities in D and H has thus been continued. Particulars of the magnetic "character" of individual days on the international scale "o" (quiet), "1" (moderately disturbed) and "2" (highly disturbed) have been contributed quarterly as in recent years to Prof. van Everdingen, at De Bilt, for inclusion in the international lists. Full details will be found in the *Geophysical Journal*. The accompanying table shows the number of days in each month to which the "characters" o, 1 and 2 were assigned. It also gives for each month the mean of the "character" figures treated as if ordinary arithmetical quantities. As there is a wide range in the disturbance to which any one figure is attached, the monthly means should be regarded as giving only a general indication of the disturbance prevailing.

| 1920.                      | Number of Days having Magnetic "Character." |      |      | Mean of<br>"Character"<br>Numbers. |

| Year (Totals and Means) .. | 181   | 144  | 41   | 0·62                               |

The mean "character" figure is lower than for 1919, there being a decrease in the number of disturbed days both of greater and lesser disturbance. The standard, however, cannot claim to be an invariable one. May, June and July were the quietest months, and the equinoctial months the most disturbed. The largest disturbances of the year occurred on the following dates: February 16th, 24th; March 4th, 5th, 22nd, 23rd; April 15th; July 15th; September 22nd, 28th; November 26th; December 4th, 26th. The disturbance of March 22nd-23rd was much the largest of the year, and was a really notable one. The D and H traces both went off the sheet, the ranges exceeding  $2^{\circ} 2'$  and 805 γ respectively. The range in V was fully 800 γ.

The D and H traces both showed some very large rapid movements. These included an easterly movement in D of 95' in about five minutes, and an oscillation of 76' west and 95' east in less than twenty minutes. Oscillations of shorter period in D and H also occurred at times, especially during the latter part of the storm, but were not outstanding. The range in V was large, but few of the changes were rapid. September was remarkable rather for the small number of quiet days than for the amplitude of disturbance.

In arriving at the international "character" figures the curves of all three elements are taken into account. Disturbance in V is practically never seen at Kew Observatory unaccompanied by disturbance in D and H, and it is immaterial whether the V curves are taken into consideration or not. But on individual occasions H disturbances may be much more prominent than D disturbances, and conversely. In compiling the weekly chronicle now got out at Kew Observatory for Mining Engineers D only is under consideration, also the object in view is somewhat

different. In assigning international "character" figures the primary object is to classify whole days as quiet or disturbed. In the case of Mining Engineers the precise period of the day which is highly disturbed is of importance. Two-hour periods are dealt with, and when a particular day has "character" 2 assigned to it the periods during which the D curve has that "character" are particularised. The number of disturbed periods at different hours of the day during 1920 was as follows:—

| Hour                | oh-2h | 2h-4h | 4h-6h | 6h-8h | 8h-10h | 10h-12h | 12h-14h | 14h-16h | 16h-18h | 18h-20h | 20h-22h | 22h-24h |
|---------------------|-------|-------|-------|-------|--------|---------|---------|---------|---------|---------|---------|---------|
| Disturbed occasions | 14    | 12    | 11    | 4     | 2      | 2       | 5       | 8       | 14      | 21      | 18      | 17      |

This represents a total for the year of 128 occasions, i.e. 256 hours, considered highly disturbed, and to these 256 hours the twelve hours 4h to 16h G.M.T. contributed only 64, or exactly one quarter. The monthly totals of disturbed hours varied from 34 in March to only 4 in August.

The data for Mining Engineers are issued within a few days of the end of the week, so that the "characters" have to be settled promptly and for only a few days at a time. Also the D curves only are considered. Thus a considerable difference between these "character" figures and those obtained for De Bilt would not be surprising. The days awarded "characters" 0, 1 and 2 for the Mining Engineers numbered respectively 173, 156 and 37, giving a mean "character" for the year of 0.63, which differs by only 0.01 from that derived after the international method. For individual months, however, the differences between the results of the two methods were considerable.

Prior to 1918 diurnal inequalities were given only for the five international quiet days, and the practice was to smooth the curves by hand. As little smoothing is naturally called for on quiet days, the operation was not onerous. With the publication, however, of diurnal inequalities derived from ordinary days, the procedure was much less satisfactory. To employ different methods for different types of days did not appear desirable. Accordingly all the curves for 1920, whether D or H, have been measured with a scale enabling a mean value to be assigned for 60-minute intervals. These intervals were taken centering at exact hours G.M.T. The old procedure having been to measure at the exact hour, there is no difference as regards the time to which the hourly means refer. But in the event of Fourier co-efficients being calculated at some future date, correction factors not previously required would have to be applied to the results obtained for 1920.

The diurnal inequalities for D from ordinary days are given in Table LXIa. Of the 37 days omitted as highly disturbed 23 occurred in the four equinoctial months, 7 in the four summer months and 7 in the winter months.

The diurnal inequalities for D and H from the international quiet days are given in Tables LXIb and LXII.

The international quiet days had the following dates:—

|             |    |     |     |     |    |              |    |     |     |     |    |
|-------------|----|-----|-----|-----|----|--------------|----|-----|-----|-----|----|
| January ..  | 4, | 5,  | 13, | 19, | 27 | July ..      | 2, | 3,  | 21, | 28, | 29 |
| February .. | 2, | 3,  | 9,  | 23, | 29 | August ..    | 2, | 6,  | 17, | 27, | 28 |
| March ..    | 2, | 3,  | 29, | 30, | 31 | September .. | 6, | 12, | 20, | 21, | 26 |
| April ..    | 1, | 11, | 13, | 14, | 28 | October ..   | 3, | 14, | 20, | 21, | 30 |
| May ..      | 6, | 7,  | 11, | 22, | 23 | November ..  | 8, | 10, | 14, | 23, | 24 |
| June ..     | 2, | 8,  | 14, | 18, | 22 | December ..  | 1, | 11, | 12, | 22, | 30 |

In all the inequalities the non-cyclic changes have been allowed for in the usual way, i.e., by assuming them to come in at a uniform rate throughout the day. The units employed are  $r'$  in declination and  $1\gamma$  (or  $1 \times 10^{-5}$  C.G.S.) in horizontal force. In the case of declination the minus sign means that the magnet points to the east of its mean position for the day. Inequalities are given for each month of the year, for the year as a whole, and for three seasons defined as in previous years.  $x$  and  $n$  are attached to the maximum and minimum hourly values

There is as usual a distinct difference in type between the diurnal inequalities of D on quiet and ordinary days. Except in June the easterly deviation near midnight is decidedly smaller in the quiet days. The difference is especially marked in the winter months. At that season the principal minimum (i.e., the easterly extreme) tends to appear a little before midnight instead of in the early morning. Both the ordinary and quiet day inequalities show this pre-midnight minimum in January, November and December, and in the ordinary day inequalities it appears also in September and October. The principal maximum is found the whole year round at 12h, 13h or 14h, alike in ordinary and quiet days, occurring at 13h in eight months out of the twelve.

In Table LXII the occurrence of the minimum in H at 1h in December is abnormal. The usual hour of occurrence in December as in other months is 10h or 11h. The occurrence of the maximum value in the morning in January, February, March, November and December is quite normal. In the summer months, as usual, the maximum in the afternoon is much more prominent than the secondary maximum in the forenoon.

Table LXIII gives the inequality ranges and Table LXIII $\alpha$  the non-cyclic changes (24h-oh). In the case of D the ordinary day range exceeds the quiet day range in the inequalities for the year, winter, equinox, and nine months out of the twelve. In the winter months the excess is considerable, taking into account the absolute size of the range at that season. In the average summer month the difference is small, the excess of the quiet day range in June being decided.

Comparing the D ranges in 1920 with the corresponding ranges in 1919 we find the latter to be in excess in the case of the year, equinox and summer; but in winter the 1920 range is decidedly the larger. The 1919 range is the larger in seven or in eight months out of the twelve, according as we take ordinary or quiet days. In the case of H, on the other hand, the excess lies with 1920, very slightly in the case of the year and very decidedly in the case of summer. The 1920 range is the larger from February to August inclusive, but the 1919 range the larger in the other five months. Taking both elements into account, we should infer in the later months of 1920 a slight decline in the activity of the forces to which the diurnal inequality is due.

The algebraic means of the non-cyclic changes in Table LXIII $\alpha$  are  $+0'04$  for ordinary and  $+0'16$  for quiet days in D, and  $+3'3\gamma$  in H. As D is falling rather rapidly through secular change, this implies an appreciable westerly tendency on the average quiet day. In H the non-cyclic change was positive in every month; its mean value for the year is fairly normal.

Table LXVII gives the mean monthly and annual values of the magnetic elements. The results for D and H are derived from the curve measurements for the international quiet days. The values for I (Inclination) are derived from the absolute observations corrected to the mean of the day. The other elements are calculated from these. If the ordinary days had been used for D instead of the quiet days, the mean value for the year would have been  $0'1$  lower. The quiet day value was the higher in nine months out of the twelve, but the difference was only once as high as  $0'3$ , and in six months it was either zero or  $0'1$ .

Comparing the mean values for 1920 and the previous year we observe the exceptionally large fall of  $9'9$  in D. In H there is a small fall. The value of I is almost stationary, an apparent increase of only  $0'2$  being hardly significant. There is an apparent small fall in V and a rise in N. The fall in W, following mainly on the decline of D, is large, and its progression throughout the year, as shown by the monthly values, is very uniform.

TERRESTRIAL MAGNETISM :—II. NOTES ON THE MAGNETIC OBSERVATIONS MADE AT THE VALENCIA OBSERVATORY, CAHIRCIVEEN, 1920. BY L. H. G. DINES, M.A., A.M.I.C.E., SUPERINTENDENT.

Absolute observations of declination, horizontal force and inclination were taken at least twice per month and generally more frequently. The instruments used were the same as in previous years, i.e., Dover unifilar, No. 139, and Dover dip circle, No. 118.

All the observations were made at fixed hours, the mean times being  $10^h\ 21^m$  G.M.T. for the declination;  $11^h\ 39^m$  for the horizontal force and  $14^h\ 30^m$  for the inclination. In no case did the time of any individual observation differ from the mean by more than eight minutes.

Only such observations of each element have been used as were taken at times when that element, as recorded by the Kew magnetographs, was subject to no abnormal disturbance.

The deflections of the mirror magnet were taken at two distances of the collimator magnet, 30 and 40 cms., and a single "distribution constant," P, calculated from them. Except in a very few cases, twelve readings of deflection were taken for each complete observation in the manner described in the notes on the observations for 1917.

The value of P was calculated for each month separately by the method employed in 1919 and described in the notes for that year. The extreme variation in the value of P did not exceed the equivalent of  $3\frac{1}{2}\gamma$  on the value of H, and this was largely accounted for by a slight accident to the mirror magnet which occurred in October, 1920, and caused a small abrupt change in the distribution constant.

Particulars of the individual observations will be found in the monthly numbers of the *Geophysical Journal*, the values of the horizontal force in which were also based on the values of the distribution constant determined as above.

Table LXVII gives the observed mean monthly and annual values of declination, horizontal force and inclination, and corresponding calculated values for the total force, and the north, west, and vertical components.

NOTES ON THE MANAGEMENT OF THE MAGNETIC INSTRUMENTS AT  
ESKDALEMUIR AND ON THE CORRESPONDING TABLES, 1920.

The magnetographs at Eskdalemuir are arranged so as to record changes of the three geographical components of terrestrial magnetic force, viz., the north component, N (or + X), west component, W (or - Y), and the vertically downward component, V (or + Z).

The north and west magnetographs are of the Adie bifilar type. In these instruments torsion of the bifilar suspension (of fine tungsten-steel wire) is used to bring the magnets into an azimuth approximately perpendicular to the direction of the components whose changes they respectively measure. During 1920 no change was made in the suspension, but the base line mirror of the W instrument was altered slightly in position on 17th January, 1920. The vertical magnetograph was that lent by the late Professor Watson and subsequently purchased from his executors. The chief difficulty encountered with this instrument relates to the base line value, which is liable to sudden and large change if any considerable artificial movement is given to the pivoted magnet system, or when the drying agent (calcium chloride) within the instrument case is changed. During 1920 there were several disturbances of the kind. On 19th February and 4th May, 1920, the control magnet, attached in a vertical position to the side of the supporting pier, was lowered. The base line value was thus reduced by about 30 γ on the first of these two dates, and by about 145 γ on the second. The drying agent was changed on 31st December, 1920.

The magnetographs are installed in an underground house in which the diurnal range of temperature is negligible. Temperature is ascertained daily at 9<sup>h</sup> 30<sup>m</sup> by the thermometers within the instrument cases. The monthly means for the year 1920, compared with the average for 1911-19, were as follows:—

*Excess of Mean Temperature above 280a.*

| Month.                | Jan. | Feb. | Mar. | Apl.       | May. | June. | July. | Aug. | Sept.      | Oct.       | Nov. | Dec. |
|-----------------------|------|------|------|------------|------|-------|-------|------|------------|------------|------|------|
| Average 1911-19 .. .. | 3·2  | 2·5  | 2·1  | <b>1·9</b> | 2·3  | 3·3   | 4·3   | 5·4  | <b>6·1</b> | 5·9        | 5·2  | 4·1  |
| „ 1920 .. ..          | 4·2  | 3·5  | 3·2  | <b>3·0</b> | 3·1  | 3·9   | 4·9   | 5·5  | <b>6·0</b> | <b>6·0</b> | 5·6  | 4·6  |

The annual range of temperature during 1920 was 3°·2 C., the mean for the previous nine years being 4°·4 C.

The constants of the magnetographs were as follows:—

|   | North.   | West.                              | Vertical. |
|---|--|------------------------------------|-----------|

Absolute observations were made weekly in the eastern magnetic hut. The results of these observations are given in the tables of auxiliary observations printed under each month along with the hourly values. Declination and horizontal force were determined on Pier No. 5 by the Elliot magnetometer, No. 60, and dip on Pier No. 6 by the Schulze Inductor, No. 103. In the deflection observations three distances, 25, 30, and 35 cm. were used. The value of the correction,  $\log_{10}(1 + \frac{P}{25^2} + \frac{Q}{25^4})$  used in the reduction of the horizontal force observations was obtained for a given month by taking the mean for seven months including the given month as fourth of the seven. The values of this correction for the different months of the year were as follows:—

January, .00577; February, .00565; March, .00553; April, .00536; May, .00532; June, .00531; July, .00550; August, .00539; September, .00547; October, .00542; November, .00550; December, .00558.

The preliminary base line values were deduced from the results of the absolute observations, any of the latter obtained during times of considerable disturbance being excluded. The base line values finally adopted were obtained from a curve drawn smoothly through points given by the preliminary values.

The hourly readings are obtained from the magnetograms by means of a ruled glass scale. The reading for any given hour G.M.T. is that ordinate estimated to be the mean reading for 60 minutes centering at the given hour. The product of this ordinate and the scale value is added to the final base value, and the sum so obtained is the hourly value printed in the tables. The mean value for the day is

$$\frac{S}{24}, \text{ where } S = \frac{0+24}{2} + 1+2+\dots+23.$$

In calculating diurnal inequalities, the non-cyclic change has been eliminated on the assumption that its time-rate is linear. Inequality values are first calculated to  $0.01\gamma$  and then rounded off to  $0.1\gamma$ . The inequalities in H, D, and I were computed from those of N, W, and V, by means of the formulæ—

$$\delta D = \frac{180 \times 60}{\pi} \left( \frac{\delta W \cos D - \delta N \sin D}{H} \right)$$

$$\delta H = \delta N \cos D + \delta W \sin D.$$

$$\delta I = \frac{180 \times 60}{\pi} \cos I \left( \frac{\delta V \cos I - \delta H \sin I}{H} \right)$$

in which  $\delta D$ ,  $\delta I$ , are expressed in minutes of arc, and where  $H$ ,  $D$ , and  $I$  for any month are the respective mean values for that month as published in Table LXVII.

The values of the harmonic coefficients were computed from the unrounded values of the inequalities. They were corrected where necessary, on account of the fact that the hourly values are not instantaneous values, but are mean values. The factors by which the coefficients have to be multiplied (*vide* Report of the British Association 1883, p. 98) are 1.00286 for  $a_1$ ,  $b_1$ ,  $c_1$ ; 1.01152 for  $a_2$ ,  $b_2$ ,  $c_2$ ; 1.02617 for  $a_3$ ,  $b_3$ ,  $c_3$ ; and 1.04720 for  $a_4$ ,  $b_4$ ,  $c_4$ . Finally, the values were rounded off to 0.1 γ.

TERRESTRIAL MAGNETISM :—IV. REVIEW OF RESULTS OF MAGNETIC OBSERVATIONS AT ESKDALEMUIR DURING 1920. BY A. CRICHTON MITCHELL, D.Sc., F.R.S.E., SUPERINTENDENT.

1. The following account summarises the principal results of the magnetic observations made during 1920.

Reference may be made to the *Notes on the Management of the Magnetic Instruments* in this and previous issues of the *Year Book* for details regarding the instruments employed and the manner in which the values of the elements are deduced from the magnetograms.

2. *Mean Values of the Magnetic Elements, 1920.*—These are given below in Table I along with the corresponding values for the previous year. The values of N, W, and V have been computed from the hourly values derived from the autographic records, standardised by means of absolute observations. Those of H, D, I, and T have been deduced from the values of N, W, and V.

TABLE I.

| Year.   | H.    | D.<br>(West)  | I.      | N.    | W.   | V.    | T.    |
|---------|-------|---------------|---------|-------|------|-------|-------|
| 1919 .. | 16713 | 16 58.7       | 69 39.6 | 15985 | 4880 | 45084 | 48082 |
| 1920 .. | 16706 | 16 49.7<br>48 | 69 39.5 | 15990 | 4836 | 45062 | 48059 |

The value of H continued to fall during the year, but the rate was about half the mean rate during the nine preceding years. Declination also diminished, and at a rate very nearly that of the mean of the last nine years. The inclination remained very nearly steady. The north component continued to rise from the minimum in 1918.

The extreme values of N, W, and V recorded during the year are given in Table II. The sign > or < indicates that the trace exceeded the limits of registration.

TABLE II.

| Component.       | Maximum. |                             | Minimum. |   | Absolute Annual Range. |
|------------------|----------|-----------------------------|----------|---|------------------------|
|                  | Value.   | Date 1920.                  | Value.   | Date 1920.  |                        |
| North .. .. ..   | > 16236  | 22 Mar. { 15 50<br>to 20 10 | < 15528  | 23 Mar. { 0 20<br>to 2 0<br>0 40<br>3 0<br>20 0<br>20 to 20 | > 708                  |
| West .. .. ..    | 5027     | 14 Mar. 14 22               | < 4363   | 23 Mar. { 0 20<br>to 2 0<br>0 40<br>3 0<br>20 0<br>20 to 20 | > 664                  |
| Vertical.. .. .. | 45419    | 24 Feb. 19 34               | < 44768  | 28 Sep. { 0 20<br>to 2 0<br>0 40<br>3 0<br>20 0<br>20 to 20 | > 651                  |

The absolute annual range of N was nearly the same as in the previous year. The ranges of W and of V were considerably greater.

3. *Magnetic Character of the Year.*—As explained in the *Year Book* for 1919, it has been the practice at Eskdalemuir, not only to assign character figures for each day according to the international scheme, but also to tabulate for each day two quantities which are in some manner representative of the activity of the terrestrial magnetic force. These are (1)  $\Sigma R^2$ , the sum of the squares of the absolute daily ranges of the three geographical components,\* and (2) the mean of the 24 hourly values of  $\Sigma r^2$ , the sum of the squares of the hourly ranges of these components.\* The character figures assigned to each day of 1920 under the international scheme are shown in the fourth table under each month in this volume. The daily values of  $\Sigma R^2$  and the daily means of  $\Sigma r^2$  are given in the subjoined Tables III and IV respectively. The mean monthly values of the squares of the absolute daily ranges are shown above in Table LXIIIb†.

TABLE III.

| 1920 | Values of $\Sigma R^2$ .<br>(Unit, 100 $\gamma^2$ ) |      |      |      |      |       |       |      |       |      |      |      |

| Mean | 109   | 215  | 1036 | 291  | 216  | 149   | 182   | 229  | 560   | 179  | 120  | 137  |

\*  $R_N$ ,  $R_W$ , and  $R_V$  denoting the ranges for a calendar day of the north, west, and vertical components,  $\Sigma R^2$  is written for  $R_N^2 + R_W^2 + R_V^2$ .

$\Sigma R^2$  determined thus is entered in Table III., and monthly means, such as  $\frac{1}{31} \sum_{1}^{31} (\Sigma R^2)$ , are given in Table V.

Similarly  $r_N$ ,  $r_W$ , and  $r_V$  denoting hourly ranges,  $\Sigma r^2$  stands for  $r_N^2 + r_W^2 + r_V^2$ .

$\frac{1}{24} \sum_{1}^{24} (\Sigma r^2)$  is shown in Table IV., and monthly means such as  $\frac{1}{31} \sum_{1}^{31} [\frac{1}{24} \sum_{1}^{24} (\Sigma r^2)]$  in Table V.

For other methods of estimating magnetic activity see *Activity of the Earth's Magnetism and Magnetic Characterisation of Days*, by G. van Dijk. Neder. Met. Inst. No. 102 (Utrecht, 1922).

† The entries in the column headed  $R_N^2$  of Table LXIIIb (p. 47) are the means of the daily range of  $R_N^2$  for all

On March 4th, 5th, 22nd, 23rd, and 24th, September 3rd, 28th, and 29th the trace "went off the sheet" and the actual value of the range could not be determined. For the purposes of Table III, the range on these occasions has been obtained by taking the value at the edge of the sheet as the extreme value, and the entries for these days have been printed in italics.

In preparing Table IV the practice has been to omit from the daily mean any hour during which the trace was "off the sheet." In a few cases, however, when the time "off the sheet" was of short duration the value at the edge of the sheet has been taken as the extreme value.

TABLE IV.

In each month, with the exception of March, the mean values of  $\Sigma R^2$  and of  $\Sigma r^2$  were less than the corresponding values for 1919 and, with the further exception of September, were less than those for 1918. March, 1920, judged by  $\Sigma R^2$  and  $\Sigma r^2$ , was the most disturbed month of the years 1918–20.

days on which they have been actually obtained. Similarly for  $R_w^2$  and  $R_v^2$ . The entries under  $R_s^2 + R_w^2$  are the means of the daily values of these quantities for all days on which both have actually been obtained. Similarly for  $R_s^2 + R_w^2 + R_v^2$ . It may therefore happen that in any month when the value, e.g. of  $R_s^2$  has not been obtained for a particular day, the entry in the fourth column may not be equal to the sum of the entries in the first and second columns, and similarly for  $R_s^2 + R_w^2 + R_v^2$ .

A comparison of the three methods of estimating activity may be obtained from a study of Table V.

| Year 1920 .. ..      | 194                         | 137              | 35               | 0.57                   | 286                              | 13.9                             |
| Year 1919 .. ..      | 146                         | 170              | 49               | 0.73                   | 388                              | 21.1                             |
| Year 1918 (364 days) | 174                         | 132              | 58               | 0.68                   | 353                              | 18.3                             |

The results obtained by all three methods lead to the conclusion that activity in 1920 was less than in either of the two preceding years.

The ratio of the 1920 to the 1919 yearly figures is .78 for the character figures, .74 for  $\Sigma R^2$ , and .66 for  $\Sigma r^2$ .

As has been already stated, the most disturbed month of the year was March, on each system of representation of activity. With regard to the least disturbed month, agreement is not obtained, for July was the month of lowest mean character figure, while January and June were the months with lowest mean  $\Sigma R^2$  and  $\Sigma r^2$  respectively.

It is of interest to utilise the values of  $\Sigma R^2$  and  $\Sigma r^2$  for individual days to select the five quietest and the five most disturbed days in each month, and to compare the selections with those made at De Bilt. When the values of  $\Sigma R^2$  are used there is agreement in 35 cases out of 60 for quiet days, and in 47 cases out of 60 for the highly disturbed days. The use of  $\Sigma r^2$  yields agreement in 40 cases out of 60 for quiet days and in 48 cases out of 60 for highly disturbed days. The quiet days selected by means of  $\Sigma R^2$  and  $\Sigma r^2$  agree in 45 cases out of 60, while the disturbed days agree in 51 cases out of 60.

The mean values of  $\Sigma R^2$  and of the daily means of  $\Sigma r^2$  on days to which different magnetic character figures have been assigned are shown in Table VI. That there is a well-marked distinction between the mean values associated with the three classes of day is clear.

As was pointed out in the *Year Book* for 1919, the ratio of  $\Sigma R^2$  to the mean value of  $\Sigma r^2$  varies with the season of the year and with the character of the day. This is shown quite clearly by Table VII.

TABLE VII.—*Monthly Means of Daily Values of*  $\frac{R_N^2 + R_W^2 + R_V^2}{\frac{1}{24} \sum_{1}^{24} (r_n^2 + r_w^2 + r_v^2)}$

| " 1919.. .. ..     | 26.6      | 34.0      | 22.8      | 18.8      |

The yearly means of the ratio do not differ greatly from those of 1919, but Tables VI and VII tend to show that, save in the case of "o" days, the proportionate decrease in  $\Sigma r^2$  from 1919 to 1920 was greater than in  $\Sigma R^2$ . As in 1919, the value of the ratio of  $\Sigma R^2$  to  $\Sigma r^2$  on "o" days was markedly greater in summer than in winter. The seasonal variation of the ratio in the case of "I" and "z" days is not so apparent.

3a. *Daily Variation of  $\Sigma r^2$ .*—An examination of the daily variations of  $\Sigma r^2$  is of some interest. For this purpose the five international quiet days of each month were used, and the mean values of  $\Sigma r^2$  for the hour periods centred at exact hours, G.M.T., are shown in Table VIII.

TABLE VIII.—*Daily Variation of  $\Sigma r^2$ .**Means of  $\Sigma r^2$  for International Quiet Days for months and seasons.*Unit  $(10)^2$ .

The exceptionally high value at oh. in September is due to the occurrence of a "bay" on the west component trace between 23h. and 24h. on September 19th, thus affecting the reading of the hourly range entered under oh. for September 20th.\*

The daily variation in the individual months is irregular, but the seasonal means exhibit certain general features. As might be expected, winter shows greater regularity in the daily variation, as well as lower values of the daily range, of  $\Sigma r^2$ . Principal minima occur twice daily in all seasons, but it is noticeable that the morning minimum occurs earlier in summer, later in winter, and at an intermediate time at Equinox. The afternoon minimum is earliest in winter and latest in summer. The times of maxima are less well defined. Another result, which might be foreseen from the magnetic character of the days taken into consideration, is that the general features of the daily variation closely resemble those obtained from the quiet day inequality data by tabulating for each hour the sum of the squares of the rates of change in the three components of force.

The seasonal means have been submitted to harmonic analysis. In summer the variation of  $\Sigma r^2$  appears to be predominately of the 24-hour type, for the amplitude of this term is six times as great as the largest of the amplitudes of the three remaining terms. The ratio of the amplitudes of the 24, 12, 8, and 6-hour terms in equinoctial months is 3.5 : 3.1 : 1.4 : 1, while for winter months the relative magnitudes of the corresponding amplitudes are 7.2 : 12.0 : 2.4 : 1.

4. *Diurnal Inequalities.*—In accordance with the practice of recent years, diurnal inequalities have been calculated for (1) five international quiet days, (2) five selected disturbed days, and (3) all days, for each month. The details are contained in Tables XLIX to LXI†.

In each class of day and in the case of each of the three components of magnetic force the mean diurnal inequality range for the year was less than in either 1919 or 1918, while with the single exception of the inequality range of the west component for disturbed days, the ranges were the smallest of the years 1917–20.

The west and vertical inequality ranges on quiet days in winter were higher than the corresponding ranges in 1919. This is to be attributed to the high values of the inequality ranges of these components in February, the west and vertical inequality ranges being the highest for this month since 1911 and 1914 respectively. The inequality range of the north component on quiet days was high in June, July, and August, being especially so in June.

\* The records of the Vertical component were defective on January 4th, 5th, two of the international quiet days. The values of  $r^2$  on January 20th, 31st, two quiet days, were used instead.

† See also Plates II and III.

For the selected disturbed days, the inequality ranges were less than in 1919 in all seasons, with the exception of the north component in winter and the west in equinoctial months. It may be remarked that the west inequality range of 1317 in March was the highest for that month since 1915, and that the vertical ranges in February and March were higher than usual.

The January and February north component inequality ranges for "all days" were the highest since 1911 for those particular months.

5. *Harmonic Coefficients of the Diurnal Inequality.*—For quiet days the general tendency was for the amplitudes to be less than in 1919, although  $c_1$  and  $c_2$  for the north components in summer, and  $c_1$  for the west and vertical components in winter were greater than the corresponding values in 1919. The phase angles of the 24-hour and 12-hour terms for the west component were somewhat greater in all seasons of 1920 than in 1919, while for the north component the phase of these terms was retarded in winter and accelerated in summer.

In the case of disturbed days, too, the amplitudes were generally smaller than in 1919. It may be noted that for the north component the value of  $c_1$  in winter was the largest in that season since 1915, while the corresponding term in equinoctial months was unusually small. There was no very definite general change in the phase angles of the two principal terms, save in the case of the 24-hour term of the north component in which, relatively to 1919, there was a considerable retardation of phase in all seasons.

For "all days" also the amplitudes were mostly smaller than in 1919, and the relative decrease in value was most marked in  $c_1$  and  $c_2$  for the vertical component. Relatively to 1919, the phase of the 24-hour term for the north and vertical components was retarded in all seasons, the retardation being greatest in winter for the former and in summer for the latter component.

6. *Daily Range.*—The values of mean absolute daily range for each month of the year are given in Table IX, compared with the corresponding means for 1911–19, and the ranges are also expressed as percentages of the mean absolute daily range for the year.

TABLE IX.—*Absolute Daily Range. Mean Monthly Values.*

For each component of force, in each season, the mean value of the daily range was less in 1920 than in 1919.

As was remarked on a former occasion, it may be noted that the daily range of the north, relatively to that of the west component, is noticeably smaller in the first two and last two months of the year.

The high values of the mean range of the north and west components in March are noteworthy, for after the values for August 1917, they are the highest for these components for any month of the period 1911-20.

The quietest days of each month of the year were January 5th, February 3rd, March 3rd, April 25th, May 7th, June 8th, July 28th, August 1st, September 25th, October 30th, November 23rd, December 21st, the last of these being the quietest day of the year, with ranges of 20γ, 11γ, 4γ, in N, W, and V respectively.

The frequency distribution of ranges recorded during the year, according to different amounts, is given in Table X.

TABLE X.—*Frequency Distribution of Absolute Daily Range.*

| Range<br>γ       | No. of Cases, 1920. |    |    | Percentage Distribution. |          |       |          |           |          |

In all three components the frequency distribution of range was very similar to that in 1919, but it may be noted that in the case of the west component, the intervals of maximum frequency were 60—69γ and 70—79γ in 1920, compared with 70—79γ 80—89γ, in 1919.

The frequency of days of considerable disturbance, *i.e.* of days with a range of either horizontal component of 160γ or more, was appreciably less than in 1918 or 1919. In 1920 there were 36 days on which the range of a horizontal component was 160γ or more, while there were 55 such days in 1919.

7. *Principal Magnetic Storms during 1920.*—Table XI gives particulars of the principal magnetic storms recorded during the year. The magnetograms for disturbed days are not published in this volume, but photographic copies may be obtained on application to the Director, Meteorological Office, Air Ministry, Kingsway, London, W.C.2.

TABLE XI.—*Principal Magnetic Disturbances Recorded at Eskdalemuir, 1920.*

Where the beginning of a disturbance has been marked by a "sudden commencement," the serial number is followed by an asterisk (\*), and the time entered in the second column is that of the sudden commencement. To the tabulated values of maximum and minimum the following have to be added:—

N, 15000γ; W, 4000γ; V, 44000γ.

## ATMOSPHERIC ELECTRICITY :—NOTES ON THE TABLES OF POTENTIAL GRADIENT.

At both Kew and Eskdalemuir Observatories potential gradient is determined by means of the Kelvin water-dropping apparatus.

The method of standardizing the records so as to give potential gradient in the open is explained in *Hourly Values*, 1916.

The factors used in the reduction are shown month by month in the *Geophysical Journal*, Tables V and VI, where gradient values for four hours a day are set out.

The data utilised in the preparation of the tables (page 47) are mean values for periods of 60 minutes centered at the hours of Greenwich Mean Time. Means for the selected days of each month are found and from these the mean for the month (given in the last column of the tables) is computed. The departures from this mean are corrected for the non-cyclic change before being entered in the appropriate table.

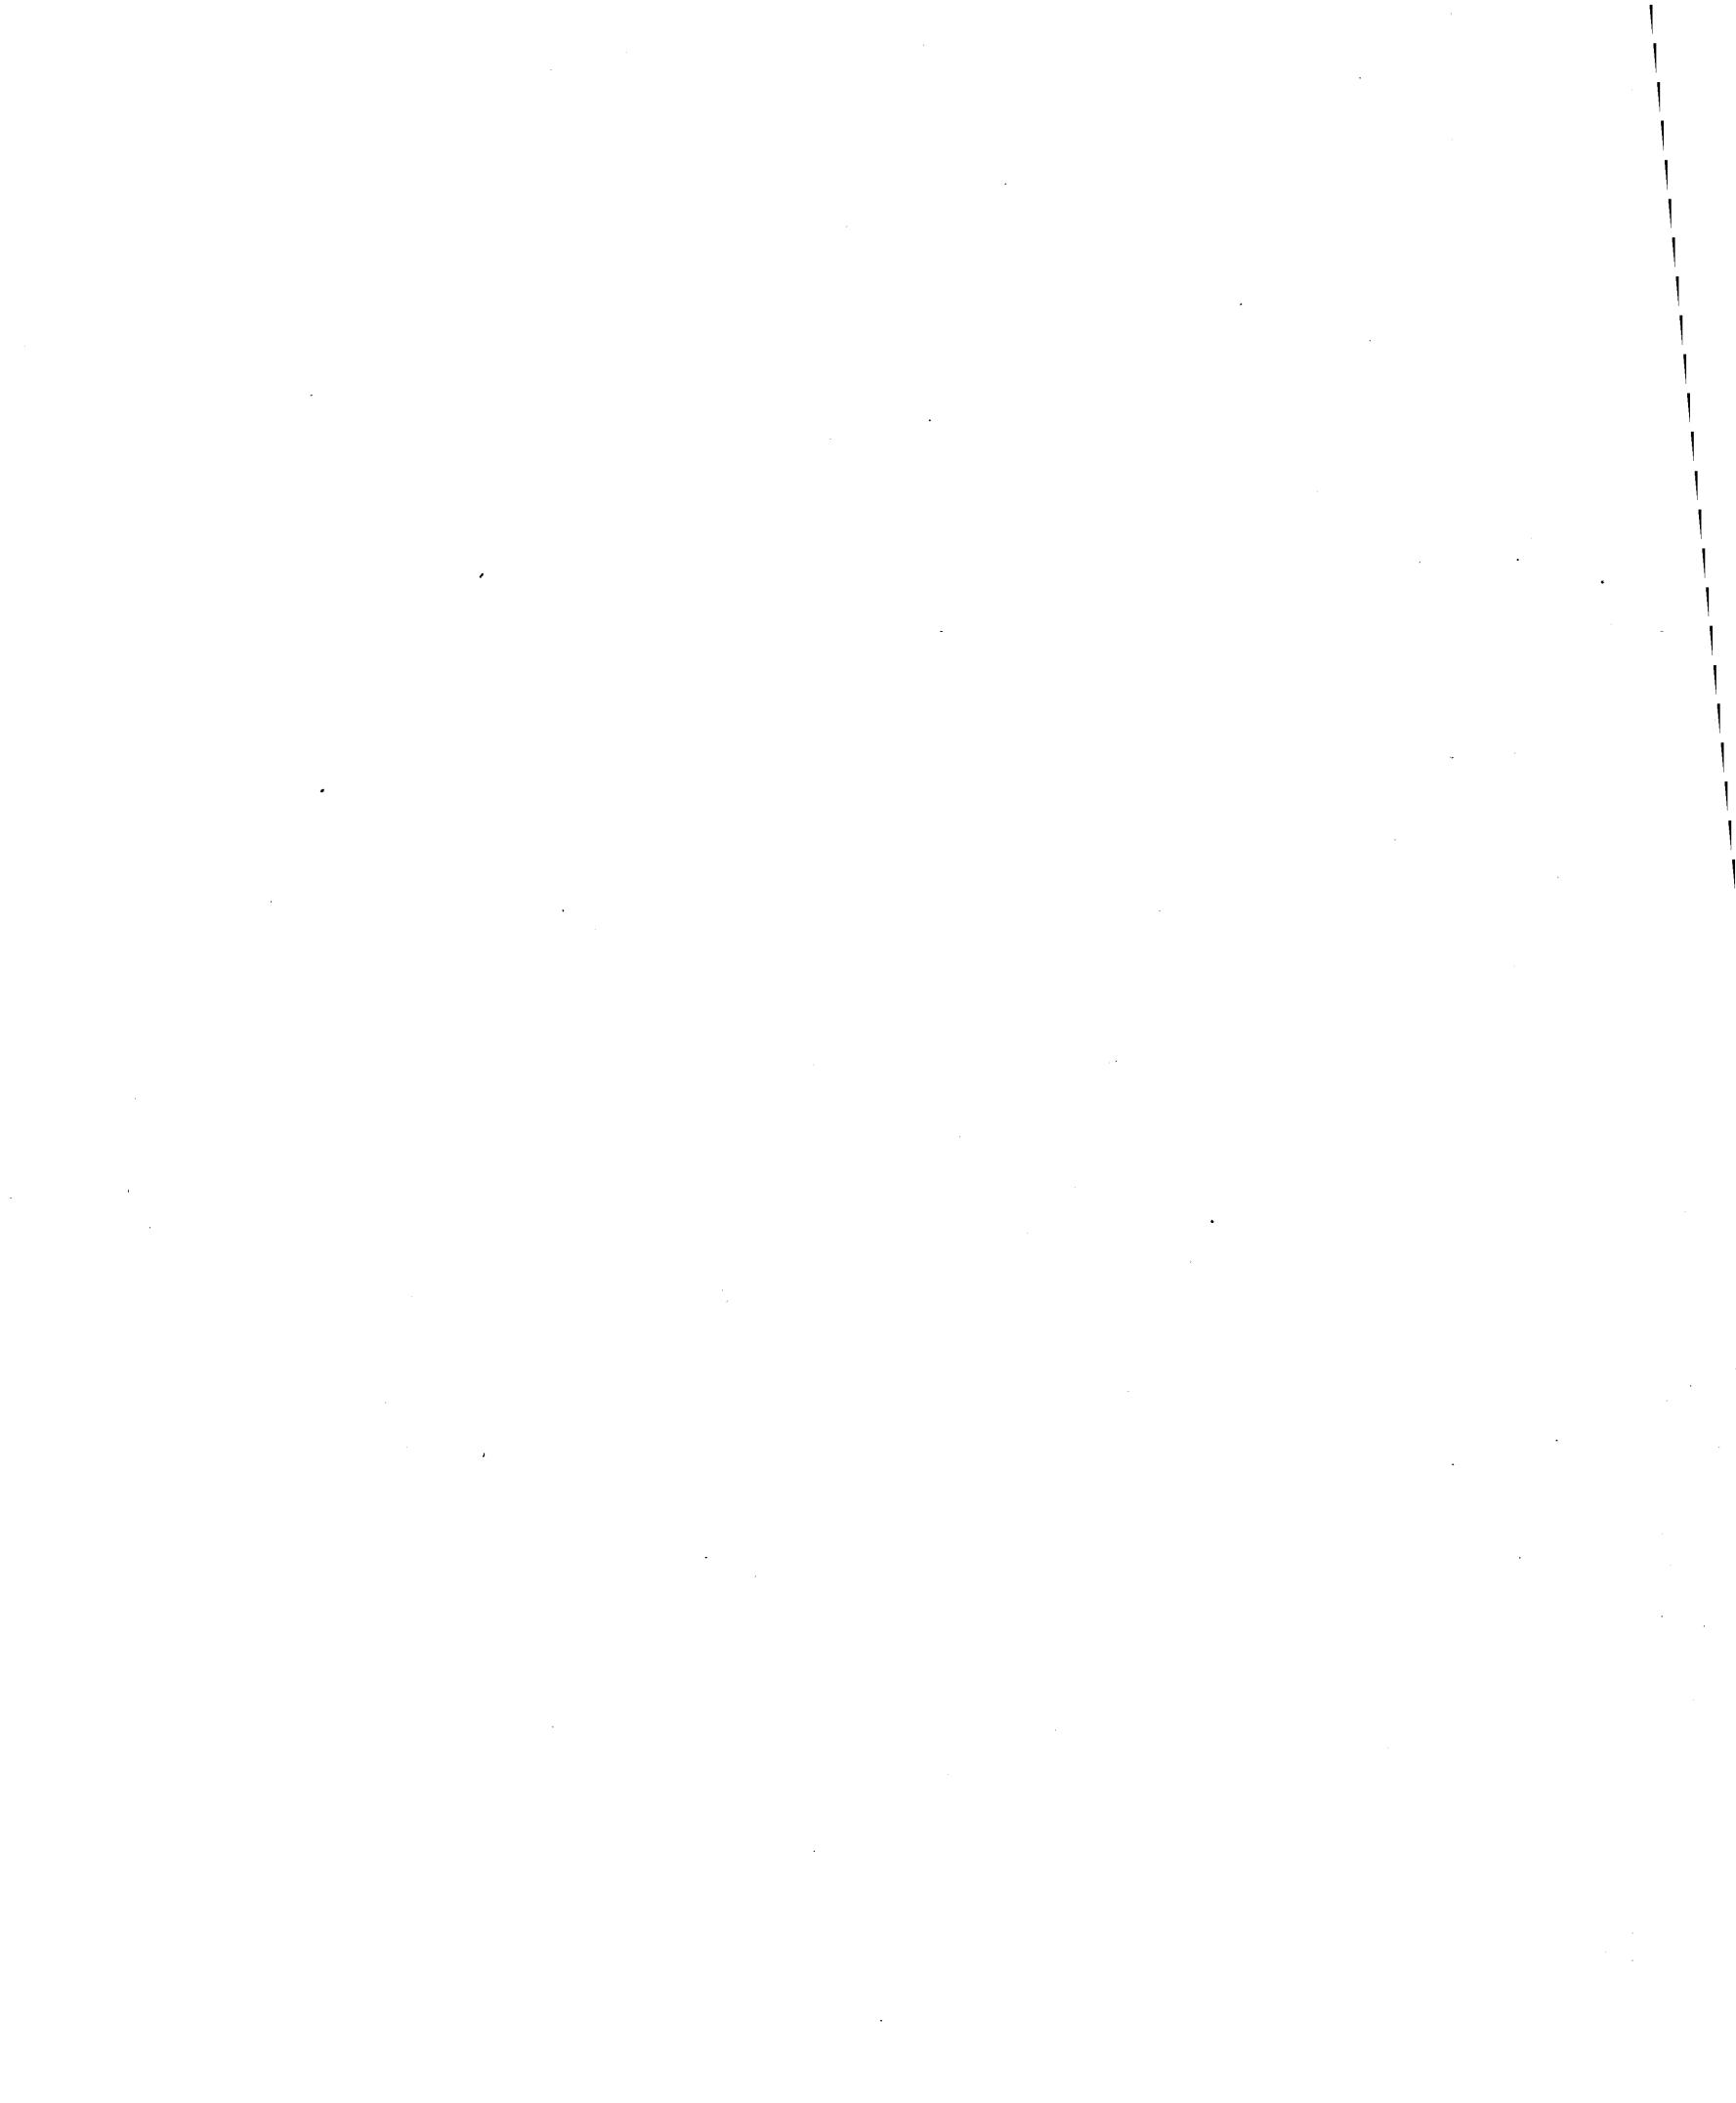

The electrograph at Kew Observatory was moved from the main building at the end of May, 1915. A discussion of the effects of this removal will be found in *Hourly Values*, 1916. The method of testing the insulation of the electrograph at Eskdalemuir is described in *Hourly Values*, 1917.

For Kew Observatory (Table A) the inequalities and the mean Monthly and Annual Values are based on the curves of quiet days, selected from those entirely free from negative potential. Other objects in the selection of quiet days are freedom from large irregular movements, absence of indications of inferior insulation in the electrograph, and the avoidance so far as possible of large non-cyclic changes. The selected quiet days numbered 10 in each month. To obtain this number, however, in April it was necessary to take as "days" several periods of 24 hours which did not commence at midnight. In such cases appropriate allowance was made for the non-cyclic changes but there is no entry in the column headed 24-0.

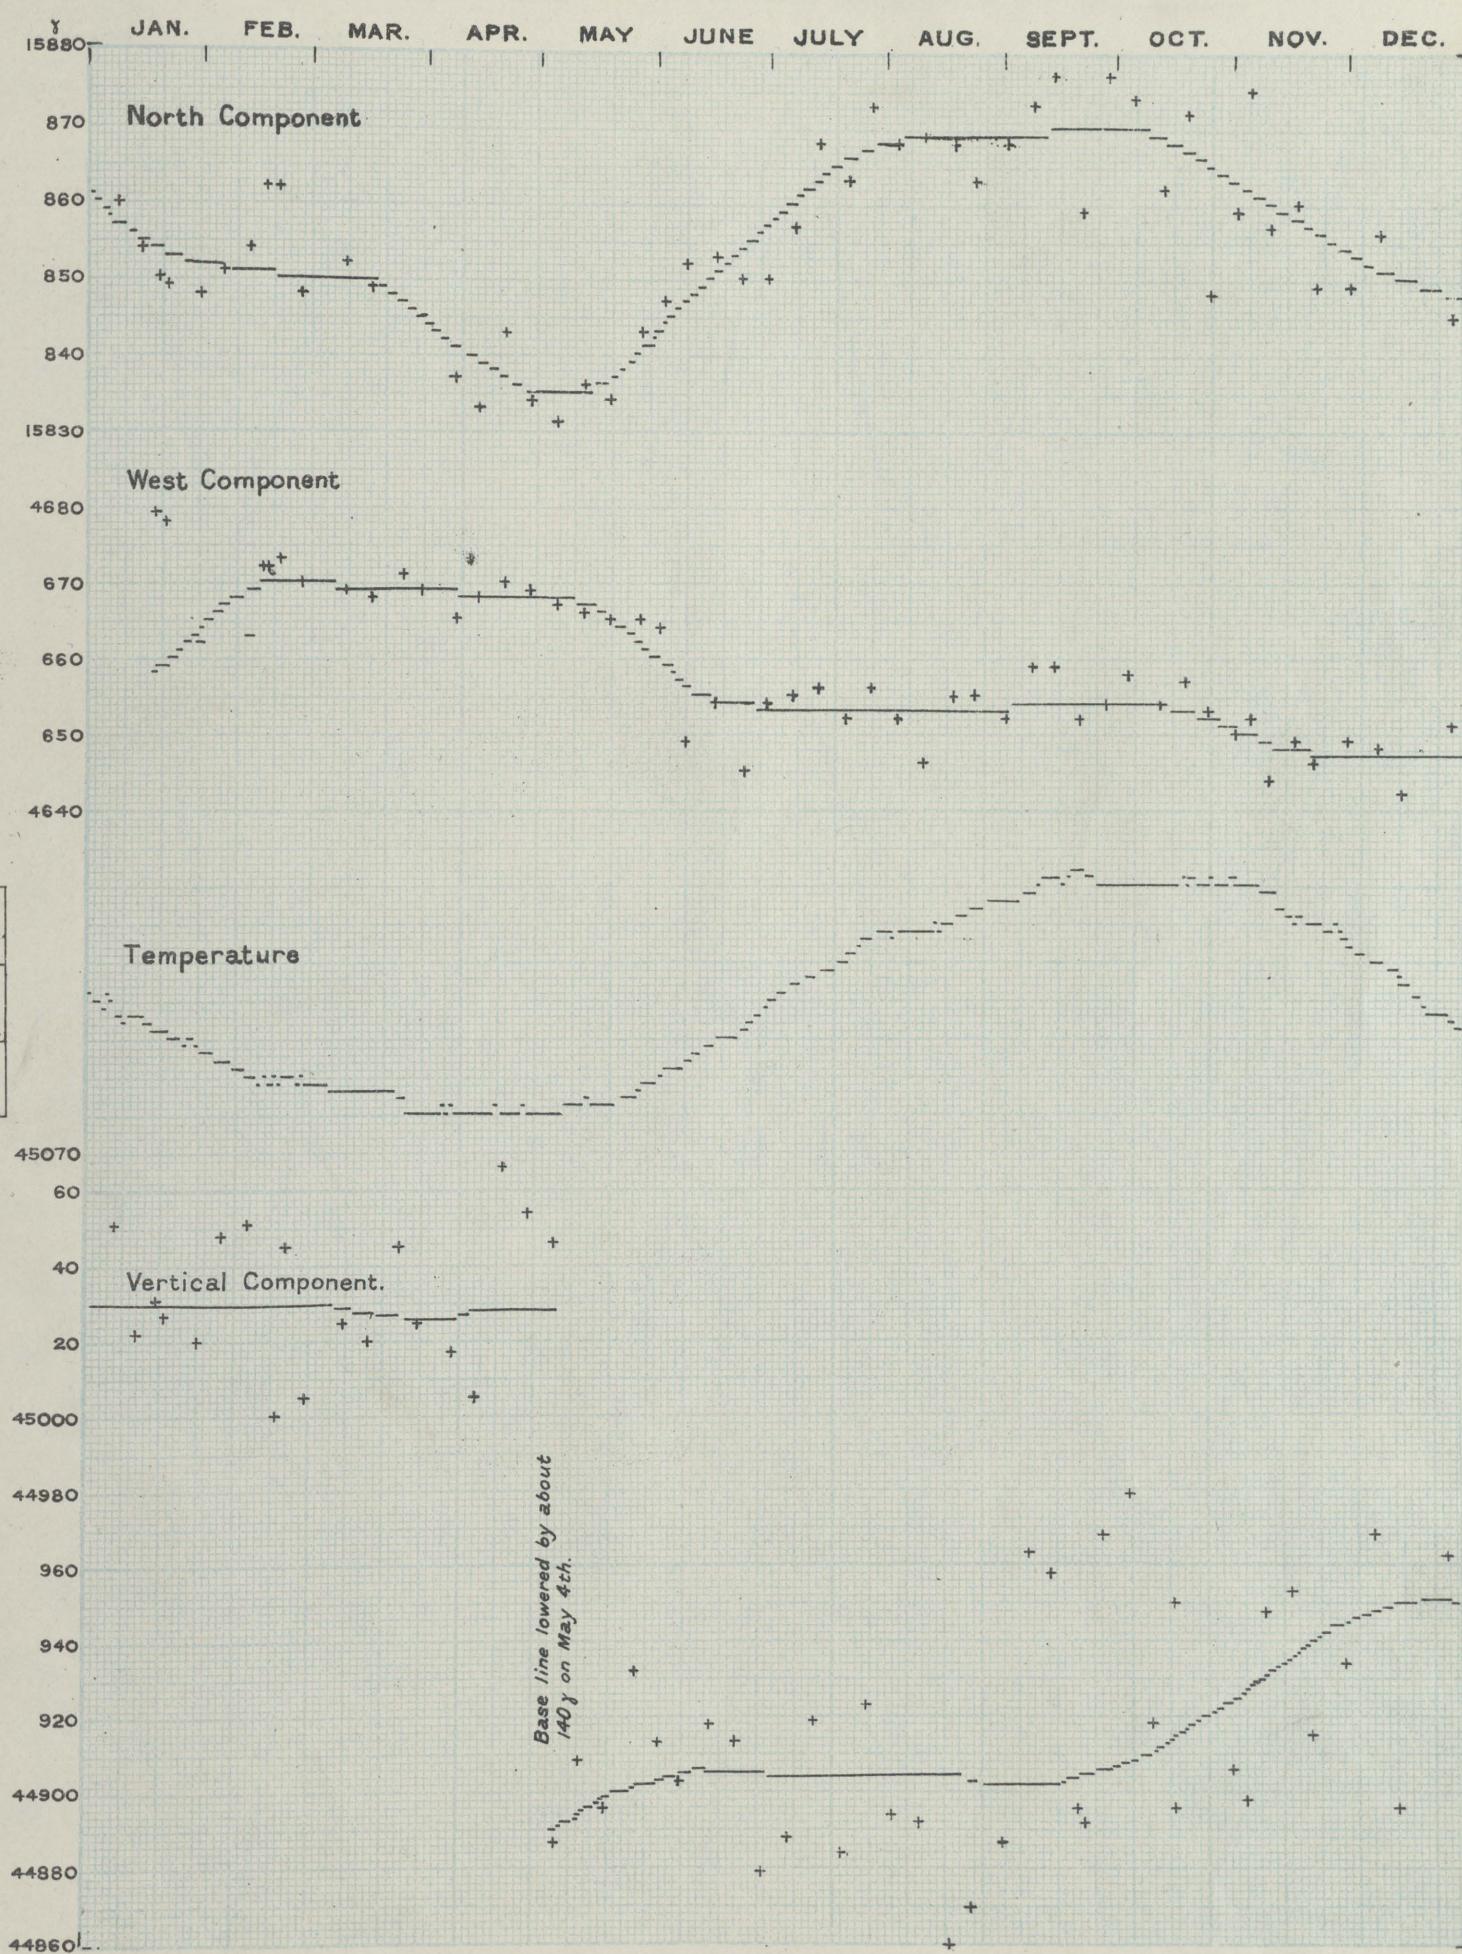

Tables B and C give the corresponding inequalities for Eskdalemuir, the former table for oa days : the latter for 1a and 2a days combined. The explanation of these symbols is as follows :—

- o, denotes a day during which from midnight to midnight no negative potential was recorded.
- 1, denotes one or more excursions of limited duration to the negative side of the scale.
- 2, denotes negative potential extending in the aggregate over 3 hours or more.
- "a," denotes that within the 25 periods of 60 minutes for which an estimate of the mean potential gradient has to be made in the process of tabulation there was in no case a range of potential gradient in the open exceeding 1000 volts.

In forming these inequalities for Eskdalemuir, only those days were used on which all the 24 hours were available. The number of days employed in the several months in these two tables is specified, being highly variable.
