SEPTEMBER 12, 1901.

THE NATIONAL PHYSICAL LABORATORY.

Report on the Observatory Department for the Year ending December 31, 1900.

The work at the Kew Observatory in the Old Deer Park at Richmond, now forming the Observatory Department of the National Physical Laboratory, has been continued during the year 1900 as in the past.

This work may be considered under the following heads :—

- I. Magnetic observations.
- II. Meteorological observations.
- III. Seismological observations.
- IV. Experiments and Researches in connexion with any of the departments.
- V. Verification of instruments.
- VI. Rating of Watches and Chronometers.
- VII. Miscellaneous.

I. MAGNETIC OBSERVATIONS.

The Magnetographs have been in constant operation throughout the year, and the usual determinations of the Scale Values were made in January.

The ordinates of the various photographic curves representing Declination, Horizontal Force, and Vertical Force were then found to be as follows :—

Declinometer : 1 cm. = $0^{\circ} 8' 7''$.

Bifilar, January, 1900, for 1 cm. $\delta H = 0.00051$ C.G.S. unit.

Balance, January, 1900, for 1 cm. $\delta V = 0.00049$ C.G.S. unit.

The distance between the dots of light upon the vertical force cylinder having become too small for satisfactory registration, the dots were separated on June 20 by slightly altering the position of the zero mirror.

The curves have been quite free from any large fluctuations ; indeed, no unusual disturbance has been registered for some time past. The principal variations that were recorded during the year took place on the following days :—

January 19th–20th ; March 8th–9th and 13th ; May 5th.

The hourly means and diurnal inequalities of the magnetic elements for 1900, for the quiet days selected by the Astronomer Royal, will be found in Appendix I.

A correction has been applied for the diurnal variation of temperature, use being made of the records from a Richard thermograph as well as of the eye observations of a thermometer placed under the Vertical Force shade.

The mean values at the noons preceding and succeeding the selected quiet days are also given, but these of course are not employed in calculating the daily means or inequalities.

The following are the mean results for the entire year :—

Mean Westerly Declination.....	16° 52'·7
Mean Horizontal Force	0·18428 C.G.S. unit.
Mean Inclination	67° 11'·8
Mean Vertical Force.....	0·43831 C.G.S. unit.

Observations of absolute declination, horizontal intensity, and inclination have been made weekly as a rule.

A table of recent values of the magnetic elements at the Observatories whose publications are received at Kew will be found in Appendix IA to the present Report.

A course of magnetic instruction was given to Captain Denholm Fraser, R.E., charged with a magnetic survey of India, and facilities were afforded him for making experiments with a view to improving the instrumental outfit for the survey.

A new magnetic hut was erected early in the year by Mr. Eldridge. It is larger and better lighted than the old hut, and has proved very useful.

II. METEOROLOGICAL OBSERVATIONS.

The several self-recording instruments for the continuous registration of Atmospheric Pressure, Temperature of Air and Wet-bulb, Wind (direction, pressure and velocity), Bright Sunshine, and Rain have been maintained in regular operation throughout the year, and the standard eye observations for the control of the automatic records have been duly registered.

The tabulations of the meteorological traces have been regularly made, and these, as well as copies of the eye observations, with notes of weather, cloud, and sunshine, have been transmitted, as usual, to the Meteorological Office.

With the sanction of the Meteorological Council, data have been supplied to the Council of the Royal Meteorological Society, the Institute of Mining Engineers, and the editor of 'Symons' Monthly Meteorological Magazine.' On the initiative of the Meteorological Office, some special cloud observations have been made in connection with the International scheme of balloon ascents.

Electrograph.—This instrument worked generally in a satisfactory manner during the year.

The small glass beaker mentioned in last year's Report is still

employed, and by removing the sulphuric acid at regular periods—generally fourteen or fifteen days—the troubles previously experienced with the “setting” of the needle and with the shift of zero has been largely overcome.

No systematic use has been made of the thirty-six Clark cells mentioned in the 1898 Report, but they have been employed to check the scale values of the two portable electrometers.

Scale-value determinations of the electrograph were made on April 2, July 14, and October 25, and the potential of the battery has been tested weekly. Forty cells only have been employed during the year, giving about 30 volts.

With a view to promoting uniformity in procedure, the Superintendent, at the suggestion of the Meteorological Office, had an interview with Mr. C. T. R. Wilson, F.R.S., and Mr. W. Nash, of Greenwich Observatory, who were shown the electrograph arrangements and the means adopted for standardising the curves. The stoppage this entailed in the working of the instrument was utilised in giving it a thorough cleaning. A new bifilar suspension was also fitted to the needle, and the wire leading from the can to the electrometer was bedded in paraffin wax in hopes of improving the insulation.

Inspections.—In compliance with the request of the Meteorological Council, the following Observatories and Anemograph Stations have been visited and inspected:—North Shields, Glasgow, Aberdeen, Alnwick Castle, Deerness (Orkney), Falmouth, and Fort William, by Mr. Baker; and Radcliffe Observatory (Oxford), Stonyhurst, Fleetwood, Armagh, Dublin, Valencia, and Yarmouth, by Mr. Constable.

III. SEISMOLOGICAL OBSERVATIONS.

Professor Milne’s “unfelt tremor” pattern of seismograph has been maintained in regular operation throughout the year; particulars of the time of occurrence and the amplitude in seconds of arc of the largest movements are given in Table I, Appendix III.

The “disturbance” on January 20 was particularly noticeable.

The movement was the largest that has yet been fully recorded at the Observatory, the maximum amplitude being 15 mm., or 12·6 seconds of arc. The next largest disturbance was on October 29, with a maximum of 12 mm., or 9·5 seconds of arc.

The action of the boom was not altogether satisfactory during August and September, and on September 27 the old boom was replaced by a new one of standard pattern. The balance weights are at 117 mm. and the tie at 127 mm. from the cup end of the boom.

The point of the bearing pivot on the stand was also improved.

A detailed list of the movements recorded from January 1 to December 31, 1900, was made and sent to Professor Milne, and will be found in the ‘Report’ of the British Association for 1901, “Seismological Investigations Committee’s Report.”

During October a Milne seismograph, No. 31, intended to be set up at the University Observatory, Coimbra, was fitted up in the seismograph room, at the same height and in the same N.—S. direction as the Kew Instrument, and a series of comparisons were carried out till the end of the year. Several interesting features were noticed, and the results have been embodied in a paper by the Superintendent.

IV. EXPERIMENTAL WORK.

Fog and Mist.—The observations of a series of distant objects, referred to in previous ‘Reports,’ have been continued. A note is taken of the most distant of the selected objects which is visible at each observation hour.

Atmospheric Electricity.—The comparisons of the potential, at the point where the jet from the water-dropper breaks up, and at a fixed station on the Observatory lawn, referred to in last year’s ‘Report,’ have been continued, and the observations have been taken since March on every day when possible, excluding Sundays and wet days. The ratios of the “curve” and the “fixed station” readings have been computed for each observation, and these have thrown considerable light upon the action of the self-recording electrometer, especially with reference to its insulation. Some direct experiments have also been made on this point.

The reservoir holding the supply of water for the water-dropper of the self-recording electrometer is supported upon six large “Mascart” insulators, and it was thought that perhaps this system of insulating the tank could be improved upon.

A quantity of fine paraffin wax, with a high melting point, was procured from Price’s Candle Company, Limited, in rectangular blocks, and a number of cylinders of sulphur were cast at the Observatory. Three similar water tanks were supported upon three wax blocks, three sulphur blocks, and three Mascart insulators respectively. Each received a similar definite charge, and the rate of loss of charge was observed.

The observations—which are to be regarded only as preliminary—extended through May, June, and July, under various hygrometric conditions. The sulphur and paraffin when new and clean gave much the best values, but after the lapse of a few weeks the rate of loss became very similar for all three species of insulator. The deterioration was apparently due to accumulation of dust, &c. The provision of a hood or cover to the sulphur and paraffin blocks would undoubtedly improve the permanency of their insulating qualities.

Platinum Thermometry.—The paper by the Superintendent, referred to in last year’s Report, has been published in the Royal Society’s ‘Proceedings,’ vol. 67, p. 3.

V. VERIFICATION OF INSTRUMENTS.

The subjoined is a list of the instruments examined in the year 1900, compared with a corresponding return for 1899:—

	Number tested in the year ending December 31.	
	1899.	1900.
Air-meters	6	9
Anemometers	23	1
Aneroids	175	197
Artificial horizons	9	27
Barometers, Marine.....	92	139
,, Standard	85	57
,, Station	15	23
Binoculars	404	963
Compasses	43	51
Deflectors	6	1
Hydrometers	241	173
Inclinometers	9	17
Photographic Lenses	160	136
Magnets	3	1
Telescopes	561	1,345
Rain Gauges.....	19	4
Rain-measuring Glasses	44	29
Scales	—	1
Sextants	876	813
Sunshine Recorders.....	6	3
Theodolites	24	12
Thermometers, Avitreous or Immisch's	5	—
,, Clinical	16,020	20,476
,, Deep sea.....	19	83
,, High Range	62	40
,, Hypsometric	39	66
,, Low Range	103	33
,, Meteorological	2,892	2,786
,, Solar radiation	—	2
,, Standard	104	61
Unifilars	5	5
Vertical Force Instruments	1	14
Declinometers	—	1
Total	22,051	27,569

Duplicate copies of corrections have been supplied in 56 cases.

The number of instruments rejected in 1899 and 1900 on account of excessive error, or for other reasons, was as follows :—

	1899.	1900.
Thermometers, clinical	149	116
,, ordinary meteorological ...	78	79
Sextants	151	122
Telescopes	49	116
Binoculars	21	31
Various	14	28

Four Standard Thermometers have been constructed during the year.

There were at the end of the year in the Observatory, undergoing verification, 16 Barometers, 285 Thermometers, 15 Sextants, 250 Telescopes, 30 Binoculars, 2 Hydrometers, 4 Rain Measures, 2 Rain Gauges, and 4 Unifilar Magnetometers.

VI. RATING OF WATCHES AND CHRONOMETERS.

The number of watches sent for trial this year is slightly less than in 1899, the total entries being 403, as compared with 469 in the preceding year.

The "especially good" class A certificate was obtained by 98 movements.

This is a marked increase on the number obtained in 1899, and the general performance has been decidedly better.

The following figures show the percentage number of watches obtaining the distinction "especially good," as compared to the total number obtaining class A certificates :—

Year	1895.	1896.	1897.	1898.	1899.	1900.
Percentage "especially good"	16·6	30·5	28·0	22·1	26·6	35·4

The percentage is thus higher than in any previous year.

The 403 watches received were entered for trial as below :—

For class A, 320; class B, 60; and 23 for the subsidiary trial. Of these 21 passed the subsidiary test, 55 failed from various causes to gain any certificate, 50 were awarded class B, and 277 class A certificates.

In Appendix II will be found a table giving the results of trial of the 51 watches which gained the highest number of marks during the year. The highest place was taken by Mr. A. E. Fridlander, of Coventry, with the keyless going-barrel Karrusel lever watch, No. 25,582, which obtained 90·1 marks out of a maximum of 100.

This is the first English lever watch to reach the 90 marks limit, and its performance is the best since 1892.

Marine Chronometers.—During the year, 53 chronometers have been

entered for the Kew A trial and 1 for the B trial. Of these 44 gained A certificates, 1 a B certificate, and 9 failed.

The mean-time chronometer Arnold 86, and the hack chronometer Molyneux 2123 have been cleaned and re-timed.

VII. MISCELLANEOUS.

Commissions.—The work under this heading has been of a very varied character during the year. The following instruments have been procured, examined, and forwarded to the various Observatories on whose behalf they were purchased :—

For Lisbon and Portuguese W. Africa, a transit theodolite, a declinometer, a dip circle with two needles, a centre-seconds watch, and two chronometers.

For Mauritius, a Mason's hygrometer, an ordinary maximum and two solar maximum thermometers.

For the Central Physical Observatory, St. Petersburg, and the Baron Toll Expedition: A dip circle with six needles, two prismatic compasses, two aneroid barometers, a Robinson cup anemograph, a chronometer, and a deck watch.

For de Bilt (Utrecht), a vertical force magnet.

Paper.—Prepared photographic paper has been supplied to the Observatories at Hong Kong, Mauritius, Lisbon, Toronto, St. Petersburg, Stonyhurst, Oxford (Radcliffe); and through the Meteorological Office to Aberdeen, Fort William, and Valencia.

Photographic paper has also been sent in quarterly instalments to the India Office for use at Colaba (Bombay), Calcutta, and Madras.

Anemograph and Sunshine Sheets have also been sent to Hong Kong, Mauritius, and St. Petersburg; Papier Saxe to Coimbra; and Seismograph rolls to Mauritius.

Pendulum Observations.—In June, Mr. Putnam, of the U.S. Coast and Geodetic Survey, swung half-second pendulums in the wooden room in the basement.

Library.—During the year the library has received publications from—

19 Scientific Societies and Institutions of Great Britain and Ireland,

96 Foreign and Colonial Scientific Establishments, as well as from several private individuals.

The card catalogue has been proceeded with.

Audit, &c.—The accounts for 1900 have been audited by Messrs. W. B. Keen and Co., chartered accountants. The balance sheet is appended.

PERSONAL ESTABLISHMENT.

The staff employed is as follows :—

- R. T. Glazebrook, Sc.D., F.R.S., Director of the Laboratory.
 C. Chree, Sc.D., F.R.S., Superintendent of the Observatory Department.
 T. W. Baker, Chief Assistant.
 E. G. Constable
 W. Hugo
 J. Foster } Senior Assistants in the Observatory Department.
 T. Gunter
 W. J. Boxall
 G. E. Bailey
 E. Boxall } Junior Assistants.
 G. Badderly
 Eight other Assistants.

A Caretaker and a Housekeeper are also employed.

In addition to the above, Dr. J. A. Harker has been employed in the capacity of an Assistant in the Laboratory.

(Signed) R. T. GLAZEBROOK,
Director.

APPENDIX I.

MAGNETICAL OBSERVATIONS, 1900.

Made at the Kew Observatory, Old Deer Park, Richmond, Lat. $51^{\circ} 28' 6''$ N. and Long. $0^{\text{h}} 1^{\text{m}} 15^{\text{s}} \cdot 1$ W.

The results given in the following tables are deduced from the magnetograph curves which have been standardised by observations of deflection and vibration. These were made with the Collimator Magnet K.C.I. and the Declinometer Magnet marked K.O. 90 in the 9-inch Unifilar Magnetometer by Jones.

The Inclination was observed with the Inclinometer by Barrow, No. 33, and needles $3\frac{1}{2}$ inches in length.

The Declination and Force values given in Tables I to VIII are prepared in accordance with the suggestions made in the fifth report of the Committee of the British Association on comparing and reducing Magnetic Observations.

The following is a list of the days during the year 1900 which were selected by the Astronomer Royal, as suitable for the determination of the magnetic diurnal inequalities, and which have been employed in the preparation of the magnetic tables :—

January	3, 8, 9, 30, 31.
February.....	3, 6, 7, 13, 28.
March	5, 11, 21, 27, 28.
April	3, 8, 15, 22, 25.
May.....	9, 10, 14, 21, 28.
June	10, 11, 16, 20, 25.
July.....	14, 15, 18, 22, 30.
August.....	6, 9, 10, 23, 30.
September	2, 7, 21, 25, 26.
October	2, 7, 13, 19, 31.
November	5, 6, 11, 16, 30.
December	3, 6, 15, 23, 24.

* Measured at 10 A.M. daily by gauge 1·75 feet above ground.

† The number of rainy days are those on which 0·01 inch rain or melted snow was recorded.

§ In a "gale," the mean wind velocity has exceeded 35 miles an hour in at least one hour of the twenty-four.

|| In a "calm" the mean wind velocity for the twenty-four hours has not exceeded 5 miles an hour.

‡ As registered by the anemograph.

* P.T.'s = preliminary tremors. The times recorded are G.M.T.; midnight = 0 or 24 hours.

The figures given above are obtained from the photographic records of a Milne Horizontal Pendulum; they represent E—W displacements.

RESULTS OF WATCH TRIALS. Performance of the 51 Watches which obtained the highest number of marks during the year.
